

Problem I. Three Color Vegetables

TimeLimit: 1 second
MemoryLimit: 1024 megabytes

There are three plates, each containing some green peas, carrot cubes, and corn kernels.
In one operation, you may choose one piece of food from one plate and move it to either of the other two plates.
Your goal is to rearrange the food so that each type of food is placed on a different plate. In other words, after all operations:

- all green peas are on one plate,
- all carrot cubes are on another plate, and
- all corn kernels are on the remaining plate.

The three types of food may be assigned to the three plates in any order. Find the minimum number of operations required.

Input

The input consists of three lines.
The i -th line contains three integers g_i , r_i , and y_i ($0 \leq g_i, r_i, y_i \leq 10^9$), representing the numbers of green peas, carrot cubes, and corn kernels on the i -th plate, respectively.

Output

Print one integer — the minimum number of operations required to rearrange the food so that each type of food is placed on a different plate.

Examples

standard input	standard output
1 2 3 3 1 2 2 3 1	9
1000000000 1000000000 1000000000 1000000000 1000000000 1000000000 1000000000 1000000000 1000000000	6000000000
